

# PulsePoint

## Association Management System — Progress Summary for Leadership

**Prepared for:** Supervisors and executive stakeholders | **Date:** May 21, 2026 | **Author:** Jordan Zabady |  
**Repository:** Private GitHub — pulsepoint (local: Desktop/pulse)

---

### Executive summary

Today's work established **PulsePoint**, a modern, modular **association management system (AMS)** aimed at healthcare member-based organizations. The project is positioned as a long-term alternative to legacy AMS products (e.g., Protech-scale cost and implementation timelines), with a deliberate **foundation-first** approach: multi-tenant data isolation, audited actions, controlled data migration, and honest public positioning of what is live versus on the roadmap.

**One sentence for boards and grants:** PulsePoint ships **MemberCore** (membership management) and **PulsePoint Events** (registration and check-in) as the live wedge; additional modules (Learn, Commerce, Insights, Giving, Engage, AI) are labeled **Roadmap** until they pass formal go-live gates—not implied by marketing alone.

This is **not** a superficial demo site. It is a working prototype with association-grade plumbing (tenant scoping, permissions, payment webhooks, import review workflows, and CI quality gates). The platform is designed for **PII only** (member contact and event data)—not clinical PHI—so the organization does not accidentally become a HIPAA-regulated health data platform.

### Strategic intent (what we set out to build)

- **Problem:** Legacy AMS contracts are expensive, slow to change, and bundle modules many associations never fully use.
- **Solution:** A modular platform the organization can own and extend—starting with the highest daily-use capabilities: **members + events**.
- **Delivery model:** Multi-tenant SaaS architecture from day one (each association's data isolated by organization ID).
- **Scope discipline:** We are *not* cloning twenty years of legacy edge cases in one release; expansion is gated module-by-module.
- **Competitive reference:** Product structure aligns with familiar AMS categories (membership, meetings/events, education, fundraising, commerce, marketing, analytics) while marketing honestly labels Live vs Roadmap status.

# Accomplishments — May 21, 2026 (today's session)

## 1. Product foundation and repository

- Created and scaffolded the **PulsePoint** application (Next.js 16, TypeScript, Prisma, Tailwind) in a dedicated repository, pushed to private GitHub.
- Defined product suite naming: PulsePoint Work, MemberCore, PulsePoint Events, plus roadmap products (Learn, Giving, Commerce, Engage, Insights, AI).
- Built a Protech-style marketing site with persona sections (Members, Leaders, Staff) and an honest feature catalog (Live vs Roadmap).
- Applied **HAP brand guidelines** (April 2025 palette and typography) and official logo assets for credible stakeholder previews.

## 2. Live modules (functional today)

| Module            | Capabilities delivered                                                                                                                         |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| MemberCore        | Member directory; tags; canonical staff notes; ADMIN-gated CSV export; <b>staged import</b> (upload → review → apply) for safe legacy cutover. |
| PulsePoint Events | Event setup; public registration pages; capacity and waitlist; check-in; registration status rules; Stripe checkout path when configured.      |
| PulsePoint Work   | Per-organization admin shell; role-based navigation; automation <b>exceptions queue</b> for staff triage when email or other steps fail.       |
| Demo mode         | One-click prototype access at /demo without paid Clerk accounts—signed session cookie, seeded sample org (Sterling Healthcare Association).    |

## 3. Engineering and risk controls (anti-“vibe code”)

- **Multi-tenant isolation:** All member and event data scoped per organization; automated leak checks and tests.
- **Server-side permissions:** Sensitive actions (export, import apply, delete, money paths) require real capabilities—not UI-only checks.
- **State machines:** Event registration and payment transitions enforced in code.
- **Webhooks:** Stripe (and Clerk when used) with signature verification and idempotency to prevent double charges.
- **Audit logging:** Imports, exports, deletes, registrations, and payment-related actions recorded.
- **Security:** Rate limits on public registration; security audit script in CI; documented contributor rules for auth and payment code.
- **Claims validation:** CI checks marketing copy against a product-claims registry so decks cannot drift ahead of shipped code.

## 4. Documentation for leadership, IT, and operations

- Project brief, scope wedge, operator checklist (red/yellow/green), runbooks, subprocessors table, deploy guide, free-stack and demo-mode guides.
- Clear positioning: what may be said publicly today versus what remains roadmap.

## 5. Local prototype ergonomics (today's refinements)

- **Standalone demo:** Removed dependency on paid Clerk for local leadership walkthroughs when `DEMO_MODE=true`.
- **SQLite local database:** No Docker required for prototype—`pnpm demo:setup` seeds a file-based database.
- Fixed middleware, branding, and routing issues so `/demo` → Enter demo → `/demo-healthcare` works without username/password prompts.

## Product status at a glance

| Area                                            | Status      | Meaning for the organization                                                     |
|-------------------------------------------------|-------------|----------------------------------------------------------------------------------|
| Multi-tenant data isolation                     | Ready       | One association cannot see another's members or events by design.                |
| Member directory & staff notes                  | Ready       | Single member record; notes not trapped in spreadsheets.                         |
| Member import / cutover                         | Ready       | CSV staged and reviewed before production apply.                                 |
| Events & registration (free)                    | Ready       | Publish, register, waitlist, check-in.                                           |
| Paid events (Stripe)                            | In progress | Code paths built; needs live Stripe drill and named runbook owner.               |
| Marketing vs reality                            | Ready       | Live/Roadmap labels enforced; roadmap modules not claimed as shipped.            |
| Roadmap modules (Learn, Commerce, BI, AI, etc.) | Not shipped | Admin "coming soon" pages only—do not claim in grants yet.                       |
| Privacy policy (counsel-approved)               | Not ready   | Subprocessor documentation exists; final legal text needed before public launch. |
| Production deploy                               | In progress | Deploy guide written; org-specific production smoke test pending.                |

**Overall assessment: Controlled pilot** — foundation is in place; finish operations ownership and production validation before broad go-live or grant claims beyond MemberCore + Events.

## What leadership can accurately say today

- We are building **PulsePoint**, our own modular AMS—**MemberCore** and **PulsePoint Events** are the live wedge.
- Data is **multi-tenant by design**; exports and imports are **controlled and audited**.
- **Learn, Commerce, Insights, Giving, Engage, and AI** are on the **roadmap**, labeled honestly—we are not claiming them in grants as shipped.
- We use **AI-assisted development** to move faster on UI and tests; **permissions, payments, and migration** are engineered with human review on sensitive paths.

## Organizational value (why this investment matters)

| Need                        | How PulsePoint addresses it                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------|
| Cost of legacy AMS          | Own the core wedge without million-dollar lock-in for every module upfront.                 |
| Staff productivity          | One directory, staff notes, events, and check-in in a modern admin experience.              |
| Member trust                | Tenant isolation; role-gated exports and deletes.                                           |
| Revenue integrity           | Paid registration tied to Stripe with idempotent webhooks and documented replay procedures. |
| Cutover risk                | Imports are staged and human-reviewed—not blind bulk upload.                                |
| Grant and board credibility | Public story matches shipped code; CI reduces “oversell” in decks.                          |

## Timeline expectations (realistic)

- **Today:** Working prototype suitable for leadership walkthrough via demo mode and local install.
- **Next 2–4 weeks (part-time focus):** Pilot-ready MemberCore + Events—production deploy, Stripe end-to-end test, named runbook owners, privacy counsel review.
- **Additional modules (Learn, Commerce, Insights, etc.):** Each requires roughly weeks to months per module at the same quality bar—not a one-week “add everything” effort.
- **Full Protech parity:** Explicitly out of scope for v0.1; would be a multi-year product program, not a single sprint.

## Recommended next steps (30-day operator priorities)

1. Name **runbook owners** for payment drift and import cutover scenarios.
2. Run **one production Stripe registration** end-to-end; resolve any item in the exceptions queue.
3. Route privacy content to **legal counsel**; keep the subprocessors table current for IT questionnaires.
4. Complete the **production deploy smoke checklist** on the live URL.
5. Train a data steward on the **imports review** workflow before legacy AMS CSV cutover.
6. Align grant decks and board materials with **Live vs Roadmap** claims only.

## How supervisors can support the project

- **Approve wedge-first scope** (MemberCore + Events + honest migration)—not full legacy parity in one phase.
- **Tie go-live dates to checklists**, not homepage polish alone.
- **Assign executive sponsor** and engineering/operations contacts for runbooks and production.

- **Protect accurate external claims**—roadmap modules stay labeled Roadmap until go-live gates pass.
